Faraday Avenue Genoscope sequence ID : CSODA012DD07QP1.
Inter-1st strand cDNA was primed with a NotI-oligo(dT) primer. Five prime end enriched, double-strand cDNA was digested with Not I and cloned into the Not I and EcoR V sites of the pcWvSPORT 6 vector. Library was normalized.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

ALIGNMENTS

```
comprising one or more mutated att recombination sites comprising at least one mutated att recombination sites comprising at least one mutated att recombination sites comprising at recombination in its core region that enhances the efficiency of recombination between a first nucleic acid molecule comprising the mutated att recombination site and a second nucleic acid molecule comprising a second recombination site that interacts with the mutated att recombination are used for the recombinational acid molecules. They can be used for changing vectors and methods from the present invention are used for the recombinational cloning of nucleic acid molecules. They can be used for changing vectors, targeting gene products to intracellular locations, cloaving fusion rags from desired proteins, operably linking nucleic acid molecules of interest to regulatory genetic sequences, constructing genes for fusion proteins, changing copy number, changing replicons, cloning into phages and cloning; (I), (II), (III), host cells and vectors can be used in the production of polypeptides and antibodies. The present sequence is used in the exemplification of the present invention.

```
AASO6174-AASO6322 represent Bacteriophage lambda att recombination site nucleic acid sequences, and PCR primers of the invention. The att sequences are recognised by the recombination protein lambda integrase (Int). The invention is a new method of producing a population of hybrid nucleic acids comprising mixing at least a first population of nucleic acids comprising one or more recombination sites with at least one target nucleic acid comprising one or more recombination sites and causing some or all of the nucleic acids to recombine with all or some of the target nucleic acids. The method is useful for producing a population of hybrid nucleic acids which may be the same or different. The nucleic acids may also be used to express therapeutic proteins or peptides and they acids may also be used to create novel fusion proteins by expressing different sequences linked to each other. The method allows simultaneous cloning of

or interaction between the recommination sites also a second of recombination site; and (2) an isolated nucleic acid molecule (III) comprising one or more mutated attrecombination sites comprising at comprising one or more mutated attrecombination site sites the efficiency of least one mutation in its core region that enhances the efficiency of recombination between a first nucleic acid molecule comprising the mutated attrecombination site and a second nucleic acid molecule comprising a second recombination site and a second nucleic acid molecule comprising a second recombination site, [1], (III), primers, vectors and methods attrecembination site. [1], (III), primers, vectors and methods attrement invention are used for the recombinational cloning of nucleic acid molecules. They can be used for changing vectors, targeting gene products to intracellular locations, classing vectors, targeting gene products to intracellular locations, classing vectors, targeting center proteins, operably linking nucleic acid molecules of interest centaring copy number, changing replicons, cloning into phages and clanning (1), (III), (III), host cells and vectors can be used in the production of polypeptides and antibodies. The present sequence is production of polypeptides and antibodies. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes isolated nucleic acid molecules (I) encoding an attB1, attB2, attB1, attB2, attL1, attL2, attL1, and attR2 nucleotide sequence. Also described are: (I) an isolated nucleic acid molecule (II) comprising one or more att recombination sites comprising at least one mutation in its core region that increases the specificity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isolated nucleic acid molecules encoding an attB1, attB2, attP1, attF2, attL1, attL2, attR1, and attR2 nucleotide sequence useful for the recombinational cloning of polypeptides -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Bacteriophage lambda; att; recombination site; attB; attR; attL; mutant; recombinational cloning; entry vector; destination vector; gene product targeting; fusion tag cleavage; ds.

The invention relates to improving the production of a secondary

metabolite by a fungus. This involves modulating the expression of at

metabolite by a fungus. This involves modulating the expression of at

least one ZBC (Zinc binuclear cluster protein) gene in a manner to

improve the yield of the secondary metabolite. Methods of the invention

improve the yield of the secondary metabolite e.g.

artibacterial (such as beta-lactam), an anti-hypercholesterolaemic (such

as lovastin or mevastatin), an immunosuppressant (such as cyclosporin A),

an ergot alkaloid (such as ergotamine), an angiogenesis inhibitor (such

as ovalicin), a glucan synthase inhibitor, glictoxin family of compounds,

a fungal toxin, a modulator of cell surface receptor signalling, a plant

compound. The method results in a decrease in fermentor run-time, a

decrease in the size of the fermentor required for the production of

decrease in the size of the secondary metabolite, or a decrease in the

compounds of vectors the production, which translates into decreased

construction of vectors containing the SEC genes of the invention.

In records ABLS8887-ABLS8598 represent primers that are used in

construction of vectors containing the SEC genes of the invention.

Note: The sequence data for this patent did not form part of the printed

specification, but was obtained directly from WIPO at

the productor.

Compounds of the production of the printed

specification, but was obtained directly from WIPO at

The present sequence is a primer which was used in an example illustrating an invention relating to a method for improving production of a secondary metabolite by a fungus. The method involves modulating the expression of a gene involved in the regulation of secondary metabolite production. The gene may be modulated in a manner that increases the yield or productivity of metabolite, increases the yield or productivity of metabolite, increases ceffects or competing metabolites, alters the characteristics of the effects or competing metabolites, alters the production of the metabolite, causes conditional lysis of the fungus, or increases the resistance of the fungus to deleterious effects of exposure to the resistance of the fungus to deleterious effects of exposure to the secondary metabolite. The method is useful for producing genetically modified fungi, which are useful for producing secondary metabolites such as antibacterial compounds,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antihypercholesterolaemic compounds, immunosuppressants, modulators of cell surface receptor signalling, plant growth regulators, pigments, insecticides or anti-neoplastic compounds.                                                                                                                                                     chromosomes. The invention also relates to methods for targeting insertion of heterologous DNA into plant artificial chromosomes, methods insertion of heterologous DNA into plant artificial chromosomes, methods isolated plant artificial chromosomes methods isolated plant artificial chromosome (PAC) is useful for producing a transgenic plant, which involves introducing the PAC into a plant cell. The PAC comprises a heterologous mucleic acid encoding a gene product such as enzymes, antisense RNA, KNA, FNA, FNA, Encutural proteins, marker proteins, ligands, receptors, ribozymes, therapeutic proteins, and cytokines, growth factors, antisense, blood factors, antisens, harmones, cytokines, growth factors, antisense, herbicides, or stress in a plant. The heterologous mucleic acid optionally encodes a product that provides an estimate use and/or improves the nutrient quality of the plant. The nutrient use and/or improves the nutrient quality of the plant. The heterologous nucleic acid optionally encodes a product that alters nutrient use and/or improves the nutrient quality of the plant. The heterologous nucleic acid is contained within a bacterial artificial chromosome (PAC). This producing plant artificial chromosome (YAC). This

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               임
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a eukaryotic chromosome (I) comprising one or several att sites, where an att site is heterologous to the chromosome, and permits site-directed innegarian in the presence of chromosome, and permits site-directed innegarian in the presence of lambda-integrase. Also described: (I) a platform artificial chromosome expression system (ACES) (II) comprising several sites that participate in recombinase catalysed recombination; and (2) a method (MI) for introducing a heterologous nucleic acid into a platform artificial chromosome, preferably an ACES. (II) is useful for introducing a heterologous nucleic acid molecule into a platform or a trificial chromosome, preferably an ACES. (II) is useful for producing a ranspenic animal (e.g. a fish, insect, reptile, amphibian, arachnid, or mammal) by introducing (II) by cell fusion, lipid-mediated transfection, by a carrier system, microinjection, microcall fusion, electroporation, microprojectile bombardment or direct DNA transfer into an embryonic cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for maxing a library of ACES comprising random portions of a genome. The method involves (a) mixing a first population of nucleic acid comprising one or more recombination sites with a target nucleic acid; (b) causing some or all of the nucleic acid molecules of the first population to recombine with the first target nucleic acid molecules of nucleic acid with a second population; (c) mixing the second population of nucleic acid with a second population; (c) mixing the second population or all of the nucleic acid molecules of the second population to recombine with some or all of the second target nucleic acid molecules to form a third population of nucleic acid molecules acid molecules to selecting and isolating nucleic acid molecules. Sequences ABZ58727-762 represent att recombination site sequences used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Producing artificial chromosome by introducing a nucleic acid into plant cell, selecting artificial chromosome that has one or more repeat regions with equivalent amounts of euchromatic and heterochromatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Plant artificial chromosome; PAC; transgenic plant; vaccine;

```
first expression cassette, comprising a first promoter operably linked to a nucleic acid sequence encoding a syncytium-inducing polypeptide (such as a fusogenic membrane glycoptotein) and flanked on either side by a sequence recognised by a recombinase, and/or a second expression cassette comprising a tumour-specific promoter operably linked to a nucleic acid sequence encoding a recombinase. The nucleic acid of the first expression cassette may be linked to a hypoxic response element (HRE), the second expression cassette may contain a promoter linked to a nucleic acid encoding a cytokine, and a third cassette may contain a tumour specific promoter linked to tumour specific promoter linked to the nucleic acid encoding the recombinase. The tumour
                                                                                                                                                                                                                                                                                                                                                                                        Recombinant nucleic acid vector for reducing tumour size, has expression cassette comprises a promoter linked to nucleic acid sequence encoding a syncytium-inducing polypeptide and flanked on either side by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               specific promoter is, for example, a carcinoembryonic antigen (CEA) promoter or a tyrosinase promoter and the recombinase is, for example, Cre recombinase or FLP recombinase. The invention is useful for reducing tumour size by administering the compositions as retroviral vectors, or in a cell containing the vector, to an individual in need of treatment for a disease caused by malignant cells. This sequence represents an Int recombinase site core region attnR2, required for excisive recombination.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               invention relates to a recombinant nucleic acid vector comprising a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 25 BP; 5 A; 5 C; 4 G; 10 T; 1 other;

```
The present interaction to be considered by the fragments having:

(a) Selectable marker region capable of being expressed in the recipient cell, preferably in bacteria such as Escherichia coli;

(b) Selectable marker region capable of being expressed in the recipient cell; and (c) a chimeric DNA construct comprising: (i) promoter or expressed in the recipient cell; and (c) a chimeric DNA construct comprising: (ii) promoter or expressed in the recipient cell; and court recombination sites by RNA polymerases of a cutaryoric cell or by prokaryoric RNA polymerases of and pourth recombination sites; (iii) 3' transcription terminating and polyadenylation region functional in the eukaryoric cell. The first and fourth recombination sites, or the second and third recombination sites, and preferably are identical. The first and second recombination site, and preferably are identical. The first and second recombination site, or the third and fourth recombination sites, do not recombine for other or with a same recombination site, and other or with a same recombination site. The vector is useful for the convert a DNA fragment into an inverted repeat structure. Plants of transformed with a vector from the present invention can be used in a conventional breeding scheme to produce more plants with the same conventional breeding scheme to produce more plants with the same convention of the core sequence of recombination site attBl which is given in the

ö The present invention relates to a method for in vitro cloning of a nucleic acid of interest. The method involves mixing in vitro two vectors ach comprising at least one recombination site and the nucleic acid of interest; incubating the mixture in the presence of at least one recombination protein to result in recombination of the recombination sites, leading to production of a chimeric nucleic acid molecule comprising the nucleic acid of interest; contacting hosts with the mixture; and selecting for a host comprising the chimeric nucleic acid molecule, and selecting gainst a host comprising the vectors comprising the second vector, to clone the nucleic acid. The present sequence is a recombinantion site, which may be used in the method of the present Gaps ö 93.6%; Score 23.4; DB 22; Length 25; 96.0%; Pred. ø Isolated nucleic acid molecules comprising a DNA segment having two engineered recombination sites, derived from att or lox, which flank selectable marker and comprise a core region having an engineered mutation

Claim 1; Column 18; 73pp; English.

The present invention describes an isolated nucleic acid molecule (I) comprising a first nucleic acid sequence having a defined sequence comprising a first nucleic acid sequence having a defined sequence (AACB7866 to AACB7866 to AACB7881, or an RNA sequence corresponding to AACB7866 to AACB7881. Also described are: (I) an isolated nucleic acid molecule (II) comprising a first mutated recombination site that removes one or more stop codons from the recombination site that removes one or more stop codons from the being an att or lox site; (2) an isolated nucleic acid molecule (III) comprising a first att recombination site comprising a mutation that comprising a first att recombination site comprising the above mentioned nucleic acids; and (4) cells comprising the above mentioned nucleic acids; and (4) cells comprising the above mentioned nucleic acids or (IV). The nucleic acids are used in comprising the above mentioned sites suitable for subcloning reactions. The use of nucleic acids for DNA or RNA subcloning reactions. The use of nucleic acids for DNA or RNA subcloning, highly specific, rapid, and less labour intensive.

Methods for apposing nucleic acids comprising an expression signal an a gene/partial gene, using recombinatorial cloning by incubating the nucleic acids in the presence of a recombination protein under conditions for recombination.

Claim 14; Column 18; 76pp; English.

The invention relates to a method for apposing an expression signal and a gene or partial gene, using recombinatorial cloning. The method incubates nucleic acids comprising the expression signal and the gene/partial gene in the presence of a recombination protein under conditions sufficient to cause recombination and therefore appose the expression signal and the gene or partial gene. The methods are useful for apposing an expression signal and a gene or partial gene using recombinatorial cloning. The methods are also useful for changing vectors, constructing genes for fusion proteins, changing copy number, changing replicons, cloning into phages, and cloning e.g., For products (with an attB site at one end and a loxp site at the other end), genomic DNAs, and cDNAs. The methods are highly specific, rapid, and less labour intensive than before the combination site that the chart and a loxp present sequence is a recombination site. useful for recombination cloning

AASO6174-AASO6322 represent Bacteriophage lambda att recombination site nucleic acid sequences, and PCR primers of the invention. The integrace (Int). The invention is a new method of producing a population of hybrid nucleic acids comprising mixing at least a first population of nucleic acids comprising mixing at least a first population of nucleic acids comprising one or more recombination sites with at least causing some or all of the nucleic acids to recombination sites and causing some or all of the nucleic acids to recombine with all or some of the target nucleic acids. The method is useful for producing a population of hybrid nucleic acids which may be the same or different. The nucleic acids which may be the same or different. The nucleic acids may be used to express therapeutic proteins or peptides and they may also be used to create novel fusion proteins by expressing different sequences linked to each other. The method allows simultaneous cloning of
                                              0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Producing hybrid nucleic acids, useful for expressing novel therapeutic polypeptides, by mixing the same or different nucleic acids having one or more recombination sites in the presence of recombination proteins,
                                                                                                                                                                                                                                                                                                               Bacteriophage lambda; recombination; att site; PCR primer; lambda Int;

AASO6174-AASO6322 represent Bacteriophage lambda att recombination site nucleic acid sequences, and PCR primers of the invention. The att sequences are recognised by the recombination protein lambda integrase (Int). The invention is a new method of producing a population of hybrid nucleic acids comprising an exceptionation sites with at least one target nucleic acid comprising one or more recombination sites with at least one target nucleic acid comprising one or more recombination sites and of the target nucleic acids. The method is useful for producing a population of hybrid nucleic acids which may be the same or different. The nucleic acids which may be the same or different. The nucleic acids which may be the same or different. The nucleic acids which may be the same or different is acids may also be used to exapte novel fusion proteins by expressing different sequences liked to each other. The method allows simultaneous cloning of
                                                                                                                                                                                                                Producing hybrid nucleic acids, useful for expressing novel therapeutic polypeptides, by mixing the same or different nucleic acids having one or more recombination sites in the presence of recombination proteins,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               att recombination site; core region; mutation; enhance; recombination;

```
core region has at least one engineered mutation that enhances recombination in vitro in the formation of a Cointegrate or Product DNA. These core regions can be incorporated into novel vector donor DNA molecules. The nucleic acids, vectors and methods of the invention are used to obtain chimeric nucleic acid using recombination proteins and engineered recombination sites in vitro or in vivo. The improved specificity, speed and yields of the invention facilitates DNA or RNA subcloning, regulation or exchange useful for any related purpose, e.g. in vitro recombination of DNA segments, and in vitro or in vivo insertion or modification of transcribed, replicated, isolated or genomic DNA or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to movel methods for cloning or subcloning one or

mutated attracombination site and a second muclaic acid molecule comprising a second recombination site that interacts with the mutated attracombination site. (I), (II), primers, vectors and methods from the present invention are used for the recombinational cloning of nucleic acid molecules. They can be used for changing vectors, targeting gene products to intracellular locations, cleaving fusion range from desired proteins, operably linking nucleic acid molecules of interest to regulatory genetic sequences, constructing genes for fusion proteins, changing copy number, changing replicons, cloning into phages and cloning. (I), (II), (III), host cells and vectors can be used in the production of polypeptides and antibodies. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nucleotide sequence. Also described are: (1) an isolated nucleic acid nucleotide sequence. Also described are: (1) an isolated nucleic acid nucleotide sequence. Also described are: (1) an isolated nucleic acid an eleast of it comprising one or more attracombination sites comprising at least one mutation in its core region that increases the specificity of interaction between the recombination site and second attracombination site; and (2) an isolated nucleic acid molecule (III) comprising one mutated attracombination sites comprising at least one mutation in its core region that enhances the efficiency of recombination between a first nucleic acid molecule comprising the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PCR primer attR2 used to produce a population of hybrid DNA molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bacteriophage lambda; recombination; att site; PCR primer; lambda Int;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel method for producing plant artificial chromosomes. The invention also relates to methods for targeting insertion of heterologous DNA into plant artificial diromosomes. The involves into plant artificial diromosomes. The solated plant artificial chromosomes to selected cells and tissues. The isolated plant artificial chromosome (PAC) is useful for producing a transgenic plant, which involves introducing the PAC into a plant cell. The PAC comprises a heterologous nucleic acid encoding a gene product such as enzymes, antisense RNA, ERNA, structural proteins, marker proteins, ligands, receptors, ribozymes, therapeutic proteins, and copromised proteins, vaccines, blood factors, antigens, hormones, cytokines, growth factors, antibodies, or a product that provides for resistance to diseases, insects, herbicides, or stress in a plant. The heterologous nucleic acid optionally encodes a product that provides an agronomically important trait in the plant, e.g. a product that alters nutrient use and/or improves the nutrient quality of the plant. The chromosome (BAC) or a yeast artificial chromosome (YAC). This producing plant artificial chromosomes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò
                                                                                                                                                                                                                                                                                                                                                         Producing artificial chromosome by introducing a nucleic acid into plant cell, selecting artificial chromosome that has one or more repeat regions with equivalent amounts of euchromatic and heterochromatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bacteriophage lambda; att; recombination site; attB; attB; attL; mutant; recombinational cloning; entry vector; destination vector; gene product targeting; fusion tag cleavage; PCR primer; ss.

The present interaction describes a vector of the present interaction allowing replication in a recipient cell, preferably in bacteria such as Escherichia coll; (b) selectable marker region capable of being expressed in the recipient cell; and (c) a chimeric DNA construct comprising: (i) promoter or cell; and (c) a chimeric DNA construct comprising: (i) promoter or cell; and polymerases of a cukaryotic cell or by prokaryotic RNA polymerases of a chimer dourth recombination sites; (iii) 3' transcription terminating and polyadenylation region functional in the eukaryotic cell. The first and fourth recombination sites; (iii) 3' transcription terminating sites are capable of reacting with a same recombination site, and correct capable of reacting with a second recombination site, and the third and fourth recombination sites, don't recombination site. The vector is useful for the third and fourth recombination site. The vector is useful for convert a DNA fragment into an investment structure. Plants convert a DNA fragment into an investment or subset in a recombination or subset in a subset of the convert a DNA fragment into an investment or subset in a result of the convert a DNA fragment into an investment or subset in a result of the convert a DNA fragment into an investment or subset in a present investment in a present i
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            conventional breeding scheme to produce more plants with the same characteristics or to introduce a chimeric gene for reduction of the phenotypic expression of nucleic acids. The present sequence represents the core sequence of recombination site attBl which is given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 present invention describes a vector (I) comprising operably linked

Also described: (I) a platform artificial chromosome expression system (Aces) (II) comprising several sites that participate in recombinase catalysed recombination; and (2) a method (MI) for introducing a heterologous nucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (MI) is useful for introducing a heterologous nucleic acid molecule into a platform artificial artificial chromosome, preferably an Aces. (II) is useful for producing a transgenic animal (e.g. a fish, insect, reptile, amphibian, arachmid, or mammall) by introducing (II) by cell fusion, lipid-mediated transfection by a carrier system, microinjection, microcell fusion, electroporation, microprojectile bombardment or direct DNA transfer into an embryonic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cell, preferably a stem cell or an embryo. (II) comprises a heterologous muchies acid that encodes a therapeutic product which is useful for making a library of Aces comprising random portions of a genome. ACC44612 to ACC44732 and ABP96650 to ABP96657 represent sequences used in the
                                                                                                                                                                                                                                                                                                                                      Novel eukaryotic chromosome comprising one or many att sites which permits site-directed integration in the presence of lambda-integrase, useful for site-specific recombination-directed integration of DNA of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present invention describes an isolated nucleic acid molecule (I) comprising a first nucleic acid sequence having a defined sequence (AAC87886 to AAC87881, sequences complementary to AAC87886 to AAC87881, or an RNA sequence corresponding to AAC87866 to AAC87881. Also described are: (1) an isolated nucleic acid molecule (II) comprising a first mutated recombination site that removes one or more stop codons from the recombination site to avoids hairpin formation, the recombination site of an isolated nucleic acid molecule (III) comprising a first att recombination site comprising a first att recombination site comprising a mutation that above mentioned nucleic acids; and (4) relis comprising the above mentioned nucleic acids; and (4) cells comprising the above mentioned nucleic acids or (IV). The nucleic acids are used in mutative sites suitable for subcloning reactions. The use of nucleic acids for obtaining engineered recombination in vitro or in vivo makes the methods for DNA or RNA subcloning, highly specific, rapid, and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a method for in vitro cloning of a nucleic acid of interest. The method involves mixing in vitro two vectors ach comprising at least one recombination site and the nucleic acid of interest; incubating the mixture in the presence of at least one recombination protein to result in recombination of the recombination sites, leading to production of a chimeric nucleic acid molecule comprising the nucleic acid of interest; contacting hosts with the mixture; and selecting for a host comprising the chimeric nucleic acid mixture, and selecting for a host comprising the chimeric nucleic acid molecule, and selecting against a host comprising the vectors comprising the second vector; to clone the nucleic acid. The present sequence is a recombinantion site, which may be used in the method of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           In vitro cloning of nucleic acid involves mixing vectors comprising recombination sites and/or nucleic acid, incubating mixture to produce chimeric molecule, contacting hosts with mixture and selecting host -

have the desired characteristics and/or nucleic acid segments. The methods can also be used for changing vectors. The oligonucleotides AAX78935-X78994 are used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                           82668
                                                                                                                                                                                                                       ð
                                                                                                                                                                                                                                                              염
                                                                                  AAT48210-25 are att recombination site core region DNA sequences. The core region has at least one engineered mutation that enhances recombination in vitro in the formation of a Cointegrate or Product DNA. These core regions can be incorporated into novel vector donor DNA molecules. The nucleic acids, vectors and methods of the invention are used to obtain chimeric nucleic acid using recombination proteins and engineered recombination sites in vitro or in vivo. The improved specificity, speed and yields of the invention facilitates DNA or RNA subcloning, regulation or exchange useful for any related purpose, e.g. in vitro recombination of DNA segments, and in vitro or in vivo insertion or modification of transcribed, replicated, isolated or genomic DNA or
                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method for apposing an expression signal and a gene or partial gene, using recombinatorial cloning. The method incubates nucleic acids comprising the expression signal and the gene/partial gene in the presence of a recombination protein under conditions signal and the gene or partial gene. The methods are useful for apposing an expression signal and a gene or partial gene using recombinatorial cloning. The methods are last ouseful for changing vectors, constructing genes for fusion proteins, changing copy number, changing replicons, at one end and a loxp site at the other end), genomic DNAs, and cDNAs. The methods are highly specific, rapid, and less labour intensive than prior at methods. The present sequence is a recombination site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Methods for apposing nucleic acids comprising an expression signal an a gene/partial gene, using recombinatorial cloning by incubating the nucleic acids in the presence of a recombination protein under conditions for recombination -

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                            5105512

Sequence 26, Application US/10055001A

Sequence 26, Application US/10055001A

Sequence 26, Application No. US20030049835A1

GENERAL INFORMATION:
APPLICANT: Waterhouse, Peter
APPLICANT: Helliwell, Christopher A.
TITLE OF INVENTION: Wethod and means for producing efficient silencing constructs
TITLE OF INVENTION: Using recombinational cloning
FILE REFERENCE: HELIGA

CURRENT APPLICATION NUMBER: US/10/055,001A

CURRENT FILING DATE: 2002-06-11

NUMBER OF SEQ ID NOS: 26

SOFTWARE: Patentin version 3.1

SEQ ID NO 26

LENGHH: 17691
